

Shopify Performance Review

February 2023 - February 2026 | Prepared by Ryan Shahidi

HEADLINE FINDING

The business is acquiring customers efficiently but failing to retain them. Revenue grew **+78.47% YoY**, yet only **12% of customers** place a second order and just **1.4% of sessions** convert.

WHAT THE DATA SHOWS

1

New customers drive 85% of revenue. Returning customers are 2x more valuable (\$201 vs \$94 LTV) but make up just 12% of the base. With 1,505 total customers and only 12% repeating, the business is leaving roughly \$160K in unrealized LTV on the table from existing customers alone.

2

Of 103K sessions, only 4K added anything to cart, a 96% drop off. The funnel from cart->checkout->purchase is actually healthy (75% and 33% respectively). The problem is upstream: traffic is arriving but not engaging with products.

3

The second-purchase window is concentrated and addressable. Customers who do come back overwhelmingly do so within 31-90 days of their first order. This is a narrow, predictable window, meaning a single well-timed email flow could meaningfully move the repeat rate.

4

Cohort retention is flat across all acquisition months. No cohort, regardless of when they were acquired or what discount brought them in, shows materially better retention than another. This rules out "we just need better customers" as the answer. The retention problem is structural, not a customer-quality problem.

RECOMMENDATIONS

- ➡ Launch a one-time win-back campaign to the 1,229 single-purchase customers
- ➡ Launch a 31-90 day post-purchase email sequence
- ➡ Identify cause of 96% pre-cart drop
- ➡ Measure retention rates by product ordered
- ➡ Track repeat rate (currently at 12%) as a retention KPI, and set a target of 15%+ by 2027
